Coarticulation

- Speech sounds tend to be influenced by the speech sound that surround them.
- **Coarticulation** is the **retention** of a phonetic feature that was present in a preceding sound, or the **anticipation** of a feature that will be needed for a following sound.
- A vowel or liquid that is adjacent to a nasal tends to be somewhat nasalized.

Dental vs alveolar nasals: assimilation of manner (+ place) in English

- /ð/ in *the, this, that*, etc. can become nasal before a nasal, especially /n/, as in:

/In ðə 'stri:t/ -> [ɪṅ ṅə 'stri:t]

- The nasalized /ð/ retains the dental place of articulation: [ṇ̇] (dental [ṇ̇]).

- The place of articulation of the preceding nasal /n/ is assimilated to that of /ð/: [ṇ̇]

- Compare:

/In ðə 'stri:t/ -> [ɪṅ ṅə 'stri:t]

/In ə 'stri:t/ -> [ɪn ə 'stri:t]
